

The Health Club Management System

This project aims to automate the admission and management process in gyms and fitness clubs. The manual process of gym registration and trainer selection often faces difficulties such as unavailable time slots and complex administrative tasks. The Health Club Management System addresses these issues by providing an online platform to book time slots, manage training session bookings, and handle payments electronically.

The system comprises three primary entities: Admin, Member, and Trainer.

Admin:

- Admin can log in using secure credentials.
- Admin can manage gym membership packages by adding new packages, setting costs, applying discounts, and removing outdated packages.
- Admin can manage member details, including adding, updating, and deleting member information.
- Admin can view package details of individual members.
- Admin can view attendance records submitted by trainers.
- Admin can manage training session slots, including creating, updating, and removing available slots.
- Admin can generate financial reports and attendance statistics.

Member:

- Members can log in securely using their credentials.
- Members can view their profile information.
- Members can view a list of available trainers.
- Members can review their package subscriptions and payment history.
- Members can process payments securely using electronic payment methods.
- Members can book available training session slots with trainers.

Trainer

- Trainers can log in securely using their credentials.
- Trainers can manage and update their profile information.
- Trainers can record daily attendance of gym members.
- Trainers can view booked training sessions scheduled by members.
